

CLIENT PROPOSAL
SecureStore POS

Prepared: 26 May 2026

Complete Offline POS System for Retail Shops

A ready-to-deploy desktop point-of-sale solution for shop billing, inventory, customer records, dues, reports, audit logs, and verified database backups.

INTRODUCTORY COMPLETE PACKAGE

Rs 95,000

One-time project price, kept under Rs 100,000 as requested.

Includes: software setup, shop configuration, basic training, database setup, backup configuration, and 30 days of support.

Prepared for: Retail shop / supermarket / general store client

Prepared by: SecureStore POS Developer

Platform: Windows and Linux desktop

Database: Local SQLite database with backup folder

Proposal validity: 15 days

Why this offer is hard to ignore: the client gets a locally owned POS system under Rs 100,000, while many market POS options charge monthly subscriptions that continue year after year.

Screenshot placeholders are included in this proposal. Replace each placeholder with actual app screenshots before sending to the client.

1. Executive Summary

SecureStore POS is a professional desktop point-of-sale system designed for small and medium retail shops. It helps the shop owner control billing, stock, customer dues, reports, user access, and backups from one local application.

The main value is simple: the shop can make sales faster, reduce manual stock mistakes, keep customer purchase and due records, and protect business data through automatic verified backups.

Recommended client pitch: Instead of paying monthly forever for a generic POS, the client can buy a complete local desktop POS package for Rs 95,000 and continue using it without mandatory monthly software rent.

2. Business Problems Solved

Manual Billing Problems

- Slow checkout during busy hours.
- Calculation mistakes in totals, discounts, and change.
- No proper invoice history.
- Hard to track pending customer balances.

Inventory Problems

- Stock is not reduced automatically after sale.
- Low-stock products are missed.
- No clear stock movement history.
- Manual stock adjustments are hard to audit.

Security Problems

- Anyone can change records if there are no roles.
- No audit trail for sensitive actions.
- Password sharing is common in small shops.
- No safe backup habit.

Reporting Problems

- Daily sales are difficult to summarize.
- Product-wise and cashier-wise performance is unclear.
- Profit and stock decisions become guesswork.
- Old bills are hard to find.

3. Proposed Solution

The proposed system is a desktop POS application built with Electron, React, TypeScript, Node.js, and SQLite. It runs locally on the shop computer, so the shop does not depend on an internet connection for daily billing.

AREA	HOW IT WORKS	CLIENT BENEFIT
Checkout	Cashier searches products, adds items to cart, enters customer and paid amount, then completes sale.	Fast, accurate billing with invoice and receipt.
Inventory	Stock is reduced automatically after sale. Manual stock changes require a reason.	Better stock control and fewer missing-item surprises.
Customer Dues	If payment is less than the bill total, the sale is marked pending and linked to customer details.	Shop can track outstanding balances.
Security	Admin and cashier roles, bcrypt password hashing, session timeout, failed login tracking.	Owner controls who can access management screens.
Backups	Manual and automatic backups are created in a separate backup folder and verified with checksums.	Business data is protected from accidental loss.

4. Complete Feature List

Secure Login

- Admin and cashier roles.
- Encrypted password hashes.
- Failed login tracking.
- Locked/inactive account support.
- Session timeout support.

POS Checkout

- Product search by name, brand, and category.
- Cart quantity increase/decrease.
- Discount and tax calculation.
- Paid amount and change calculation.
- Pending balance support.

Products

- Add new products.
- Edit product details.
- Purchase price and selling price.
- Brand and category fields.
- Active/inactive product status.

Stock Management

- Automatic stock reduction after sale.
- Manual stock adjustment.
- Required adjustment reason.
- Low-stock visibility.
- Inventory transaction logs.

Customer Records

- Customer name capture.
- Phone number capture.
- Customer is linked with sales.
- Duplicate phone reuse logic.
- Customer due summary.

Reports

- Dashboard metrics.
- Daily sales report.
- Product sales report.
- Cashier report.
- Low-stock report.

Receipts

- Receipt preview after sale.
- Browser/Electron print flow.
- Shop name and address settings.
- Header and footer message settings.
- Invoice number generation.

Backup & Recovery

- Manual backup button.
- Automatic daily backup scheduler.
- Backup integrity verification.
- SHA-256 checksum metadata.
- Safety backup before restore.

Audit Trail

- Login events.
- Sale completion.
- Sale voiding.
- Product changes.
- Backup and settings changes.

5. Main Screens

Add real app screenshots in the boxes below before final client delivery. Recommended screenshot size: 1280 x 800 or similar desktop ratio.

Screenshot 1: Login Screen

Insert secure login screen here.

Screenshot 2: Checkout Screen

Insert product search, cart, and payment area here.

Screenshot 3: Product Management

Insert add/edit products table here.

Screenshot 4: Reports & Backup

Insert reports, settings, or backup screen here.

6. How the System Works

Daily Sales Flow

STEP	ACTION	SYSTEM RESULT
1	Cashier signs in.	System starts secure session and applies role permissions.
2	Cashier searches/selects products.	System shows active products and available stock.
3	Items are added to cart.	Subtotal, discount, tax, total, amount due, and change are calculated.
4	Customer name/phone and paid amount are entered.	Customer is created or reused, and pending balance is tracked if payment is incomplete.
5	Sale is completed.	Sale, items, payment, stock reduction, inventory log, and audit log are saved in one transaction.
6	Receipt is printed or saved.	Customer receives bill and shop record remains searchable.

Data Storage Flow

The application stores business data in a local SQLite database. The normal live database and backup files are kept separate.

ITEM	LINUX PATH	WINDOWS EQUIVALENT
Live database	~/.config/securestore-pos/SecureStorePOS.db	C:\Users\<User>\AppData\Roaming\securestore-pos\SecureStorePOS.db
Backup folder	~/.config/securestore-pos/Backups/	C:\Users\<User>\AppData\Roaming\securestore-pos\Backups\
Backup metadata	*.db.json	*.db.json

Current verification: the live database already contains Users, Products, Customers, Sales, SaleItems, Payments, InventoryTransactions, AuditLogs, Settings, and BackupLogs tables.

7. Security and Reliability

Security Controls

- Password hashing through bcrypt.
- Backend-only database access through Electron IPC.
- Role checks for admin-only actions.
- Prepared SQLite statements.
- Safe public error messages.

Reliability Controls

- SQLite WAL mode for crash-safe committed transactions.
- Foreign-key checks enabled.
- Sale completion uses transaction-safe logic.
- Backups are verified before being accepted.
- Restore creates a safety backup first.

- Audit logs for sensitive work.

- Automatic backup scheduler is enabled.

8. Package Price

PACKAGE	INCLUDED	PRICE
SecureStore POS Standard	Desktop POS app, local SQLite database, login/users, checkout, products, stock, customer dues, reports, backup/recovery, shop settings, installation guidance, and 30 days support.	Rs 95,000

Price policy: This offer is intentionally kept below Rs 100,000 to make the decision easy for a first client while still covering real project value, setup, support, and handover.

Payment Plan

MILESTONE	AMOUNT	WHEN DUE
Advance	Rs 40,000	Project confirmation
Installation and demo	Rs 35,000	After client sees app running on shop computer
Final handover	Rs 20,000	After training and final acceptance
Total	Rs 95,000	One-time package

Optional Support After 30 Days

The first 30 days of support are included. After that, support can be continued only if the client wants it.

SUPPORT OPTION	INCLUDED	MONTHLY PRICE
Basic Support	Bug fixes, backup guidance, minor help, remote assistance when possible.	Rs 5,000
Priority Support	Faster response, small monthly adjustments, data troubleshooting, staff help.	Rs 10,000

9. Cost Comparison With Other Options

The goal is not to claim that every other POS is bad. Some cloud POS products are good. The point is that many alternatives charge monthly fees, setup fees, or higher one-time prices, while this offer gives the client a locally owned desktop POS package under Rs 100,000.

OPTION	MARKET PRICE REFERENCE	ESTIMATED FIRST YEAR COST	COMMENT
SecureStore POS Standard	Proposed fixed package	Rs 95,000	One-time package. No mandatory monthly rent for core app.
Typical POS SaaS plan	Example: Granet Pro lists POS plans from Rs 2,999 to Rs 9,999 per month.	Approx. Rs 35,988 to Rs 119,988 for year one; Rs 107,964 to Rs 359,964 over three years.	Recurring subscription. Cost continues every year.
Low-cost cloud/register POS	Example: ChecPOS search result shows around Rs 2,000 per register per month.	Approx. Rs 24,000 per year per register; Rs 72,000 over three years per register.	Lower starting cost may be possible, but subscription continues and customization/local ownership may differ.
Higher-end local POS packages	Some POS vendors show one-time business packages above Rs 100,000.	Can reach Rs 150,000 to Rs 300,000+ depending on modules.	May include more modules, but higher upfront budget.

Client decision point: If the client wants the cheapest possible subscription, there are cheaper options. If the client wants a custom-branded local desktop POS with ownership-style delivery and no compulsory monthly rent, this proposal is positioned very strongly under Rs 100,000.

10. Delivery Plan

DAY	WORK	OUTPUT
Day 1	Client details, shop name, receipt text, tax/discount settings, system confirmation.	Final setup checklist approved.
Day 2	Install and configure POS on target machine. Set initial admin/cashier users.	Application running with live database.
Day 3	Product/category setup assistance and first test sales.	Shop can run real checkout workflow.
Day 4	Reports, dues, backup, restore verification, and staff training.	Owner and cashier trained.
Day 5	Final polish, acceptance test, handover, and support window start.	Project delivered and accepted.

11. Deliverables

- SecureStore POS desktop application package.
- Local SQLite database setup.
- Shop name, address, phone, tax, currency, and receipt settings.
- Admin and cashier account setup.
- Product/category setup guidance.
- Backup folder configuration and backup testing.
- Basic staff training.
- 30 days of bug-fix support after delivery.
- Short handover guide for using checkout, products, stock, reports, and backup.

12. Assumptions and Exclusions

Included Assumptions

- Single shop / single main POS computer.
- Windows or Linux desktop machine.
- Local database storage.
- Client provides product details and prices.
- Client provides printer/hardware if printing is required.

Not Included in Rs 95,000

- Hardware purchase: computer, printer, scanner, cash drawer.
- FBR/PRA/SRB tax integration.
- Online cloud sync or multi-branch server.
- Payment gateway/card terminal integration.
- Advanced barcode label printing.
- Major custom modules after approval.

13. Future Upgrade Options

These can be added later as separate paid upgrades when the client grows.

UPGRADE	BENEFIT	ESTIMATED ADD-ON RANGE
Thermal printer direct integration	Cleaner receipt printing with shop hardware.	Rs 25,000 - 60,000
Barcode scanner workflow	Faster product selection at checkout.	Rs 20,000 - 45,000
AI sales summary	Daily Urdu/English summary of sales, low stock, and dues.	Rs 40,000 - 90,000 plus AI usage cost
Cloud backup dashboard	Owner can access backup status and summaries remotely.	Rs 75,000 - 180,000
Multi-branch sync	Central reports for multiple stores.	Separate quote

14. Acceptance Criteria

The project will be considered delivered when the following are demonstrated:

- Admin can log in successfully.
- Cashier can complete a sale.
- Stock is reduced after sale.
- Customer record is saved with sale.
- Pending balance appears when payment is incomplete.
- Daily/product/cashier reports open correctly.
- Manual backup is created and verified.
- Backup history appears in settings.
- Receipt preview/print flow works on the installed machine.

15. Final Recommendation

SecureStore POS is a strong fit for a shop owner who wants a professional local billing and inventory system without committing to high monthly software rent. The proposed Rs 95,000 package is positioned below many first-year SaaS totals when setup fees are included, while still giving the client important daily business controls.

Recommended close: Approve the Rs 95,000 package, install the POS on the shop computer, train the staff, and start using it for live billing within 5 working days.

16. References Used for Pricing Proof

These references are included to support pricing discussion. Prices can change, so final client comparison should be checked again before sending the proposal.

1. Granet Pro pricing page. Shows POS package examples around Rs 2,999, Rs 5,999, and Rs 9,999 per month, plus setup pricing references. <https://www.granetpro.com/pricing.html>
2. ChecPOS pricing search result/reference. Shows register-based POS pricing around Rs 2,000 per register per month. <https://www.checpos.pk/>
3. Pakistani POS market search references for ApnaPOS / Howmuch / similar products showing that cheaper subscription options exist, but usually with generic SaaS positioning and recurring terms.
4. Current project verification: local SQLite database at ~/ .config/securestore-pos/SecureStorePOS.db with Products, Customers, Sales, SaleItems, Payments, AuditLogs, Settings, and BackupLogs tables.
